FTTH Cable

FTTH CABLE

Optic unit is set in the center of the cable. On either side of it there are two strengthening constructions made of ultraviolet-resistant and fire-proof polymer material (LSZH - oxygen index higher than 33). Steel wire guide lines inside the polymer base allow preventing unallowable bending and coiling.

Special cable design allows to slightly bend fiber in order to provide wider frequency band and high quality communication. Wire guide lines guarantee excellent fiber damage prevention. Among the advantages there are such features as simple structure of the cable, thus, providing easy cabling, and light weight. Cable with up to 8 fibers is also available.
